

REC-CIS

GE23131-Programming Using C-2024

Sample Output 1

1

Explanation 1

- Convert the decimal number 77 to binary number: 77_{10} = $(1001101)_2$.
- $\dot{}$. The value of the 4th index from the right in the binary representation is 1.

Answer: (penalty regime: 0 %)

	Test	Expected	Got
~	<pre>printf("%d", fourthBit(32))</pre>	0	0
~	printf("%d", fourthBit(77))	1,	1

Question 2
Correct
Marked out of 1.00
F Flag question

Determine the factors of a number (i.e., all positive integer values that evenly divide into a number) and then return the p^{th} element of the list, sorted ascending. If there is no p^{th} element, return 0.

Example

n = 20

p = 3

The factors of 20 in ascending order are $\{1,2,4,5,10,20\}$. Using 1-based indexing, if p=3, then 4 is returned. If p>6, 0 would be returned.

Function Description

Complete the function pthFactor in the editor below.

pthFactor has the following parameter(s):

int n: the integer whose factors are to be found

int p: the index of the factor to be returned

Returns:

int: the long integer value of the p^{th} integer factor of n or, if there is no factor at that index, then 0 is returned

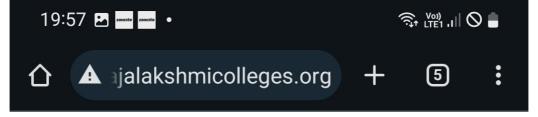

Constraints

REC-CIS

```
The second line contains an integer p, the 1-based index of
the factor to return.
Sample Case 0
Sample Input 0
STDIN Function
10 → n = 10
3 → p = 3
Sample Output 0
Explanation 0
Factoring n = 10 results in {1, 2, 5, 10}. Return the p = 3<sup>rd</sup>
factor, 5, as the answer.
Sample Case 1
Sample Input 1
STDIN Function
10 → n = 10
5 → p = 5
Sample Output 1
0
Explanation 1
Factoring n = 10 results in {1, 2, 5, 10}. There are only 4
factors and p = 5, therefore 0 is returned as the answer.
Sample Case 2
Sample Input 2
STDIN Function
1 → n = 1
1 → p = 1
Sample Output 2
Explanation 2
Factoring n = 1 results in \{1\}. The p = 1st factor of 1 is
returned as the answer.
Answer: (penalty regime: 0 %)
 Reset answer
```

~	printf("%d", myFunc(25))	0	0	~
~	printf("%d", myFunc(200))	1	1	~

Question 2
Correct
Marked out of 1.00
Flag question

Find the number of ways that a given integer, \mathbf{X} , can be expressed as the sum of the \mathbf{N}^{th} powers of unique, natural numbers.

For example, if X = 13 and N = 2, we have to find all combinations of unique squares adding up to 13. The only solution is $2^2 + 3^2$.

Function Description

Complete the powerSum function in the editor below. It should return an integer that represents the number of possible combinations.

powerSum has the following parameter(s):

X: the integer to sum to

N: the integer power to raise numbers to Input Format

The first line contains an integer X.

The second line contains an integer N.

Constraints

1 ≤ X ≤ 1000

2 ≤ N ≤ 10

Output Format

Output a single integer, the number of possible combinations calculated.

Output a single integer, the number of possible combinations calculated.

Sample Input 0

10

2

Sample Output 0

1

Explanation 0

If X = 10 and N = 2, we need to find the number of ways that 10 can be represented as the sum of squares of unique numbers.

$$10 = 1^2 + 3^2$$

This is the only way in which ${\it 10}$ can be expressed as the sum of unique squares.

Sample Input 1

100

2

Sample Output 1

3

Explanation 1

$$100 = (10^2) = (6^2 + 8^2) = (1^2 + 3^2 + 4^2 + 5^2 + 7^2)$$

Sample Input 2

100

3

Sample Output 2

1

Explanation 2

100 can be expressed as the sum of the cubes of 1, 2, 3, 4. (1+8+27+64=100). There is no other way to express 100 as the sum of cubes.

Answer: (penalty regime: 0 %)

Reset answer

```
100
2
Sample Output 1
Explanation 1
100 = (10^2) = (6^2 + 8^2) = (1^2 + 3^2 + 4^2 + 5^2 + 7^2)
Sample Input 2
100
3
Sample Output 2
Explanation 2
100 can be expressed as the sum of the cubes of 1, 2, 3, 4.
(1 + 8 + 27 + 64 = 100). There is no other way to express 100
as the sum of cubes.
Answer: (penalty regime: 0 %)
